

Gross Motor Milestones

- **The Client:**

Australia based entrepreneur, Paediatric and Neurological Physiotherapist with over 25 years' experience.

- **The Problem:**

Digitised manual for mothers who want to the best gross motor skills for their babies to be developed, this was not available on mobile platforms for ease of use

- **Our Solution:**

Greyhound Technologies Pvt. Ltd addressed the requirements of the client and came up with a solution of developing the application that would be purely mobile based and would allow users to learn different gross motor skills for their babies of age group 2 days to 12 months.

- The app has various categories on which static data has been provided along with the images for better understanding
- Information has been obtained from her website <http://www.paediatricphysiotherapycentre.com>
- The user interface is extremely smooth and simple for better UI experience.
- The application has been developed for both Android and iPhone users hence the application is completely platform independent
- A large part of the client's work is treating children who present with delayed gross motor milestones which has been made more digitised with the help of this app
- The client is a highly skilled physiotherapist and has a focus on treating children with special needs as well as treating children with lower limb dysfunction.
- Hence "Baby's Motor Milestones" has been developed to provide parents and care givers with information they need to assist in understanding their baby that little bit more.
